

A to Z of Breast Cancer

Dr R Soobrah
Breast Surgeon

Objectives

- Describe common signs of BC
- Describe Investigations and importance of **pre-operative planning**
- Operative management – axilla & breast
- Other treatment modalities
- Future ...

“ Peau d’orange ”

Inflammatory breast cancer

Inflammatory breast cancer

- Most aggressive form BC (~5%)
- Quick diagnosis!
- 30% have **stage IV** de novo disease
[Stage IV Breast Cancer: 5-year survival ~ 15-20%]
- **chemotherapy** as the **first line** of treatment with the goal of downstaging the tumour to allow for definitive surgery (mastectomy + axillary node clearance)

Before

After

Risk factors

- Risk cancer increases with age:

Age 25 ~ 1 : 20,000 (**0.005%**)

Age 30 ~ 1 : 2500

→ Age 40 ~ 1 : 200 ← Mammograms

Age 50 ~ 1 : 50

Age 80 ~ 1 : 10

Lifetime risk = 1:8 (~12%)

Table 1. Risk Factors for Breast Cancer

Nonmodifiable

- Female gender
- Age (>45 y)
- Genetic changes (mutations, *BRCA*)
- Family history of **Breast / Ovarian Ca**
- Personal history of breast cancer
- Race and ethnicity
(White > African > Asian)
- Dense breast tissue
- Certain benign breast conditions^a
- Lobular carcinoma in situ (LCIS)
- Menstrual periods
(early menarche, late menopause)
- Previous chest radiation
- Diethylstilbestrol exposure

Modifiable

- Not having children
(slight risk increase)
- Oral contraceptives
(slight risk increase)
- Depo-Provera
(slight risk increase)
- Hormone therapy after menopause
(risk increase after 2 y of use)
- Breastfeeding
(slight risk reduction)
- Alcohol consumption
(risk increase)
- Obesity (risk increase)
- Physical exercise (risk reduction)

Genes

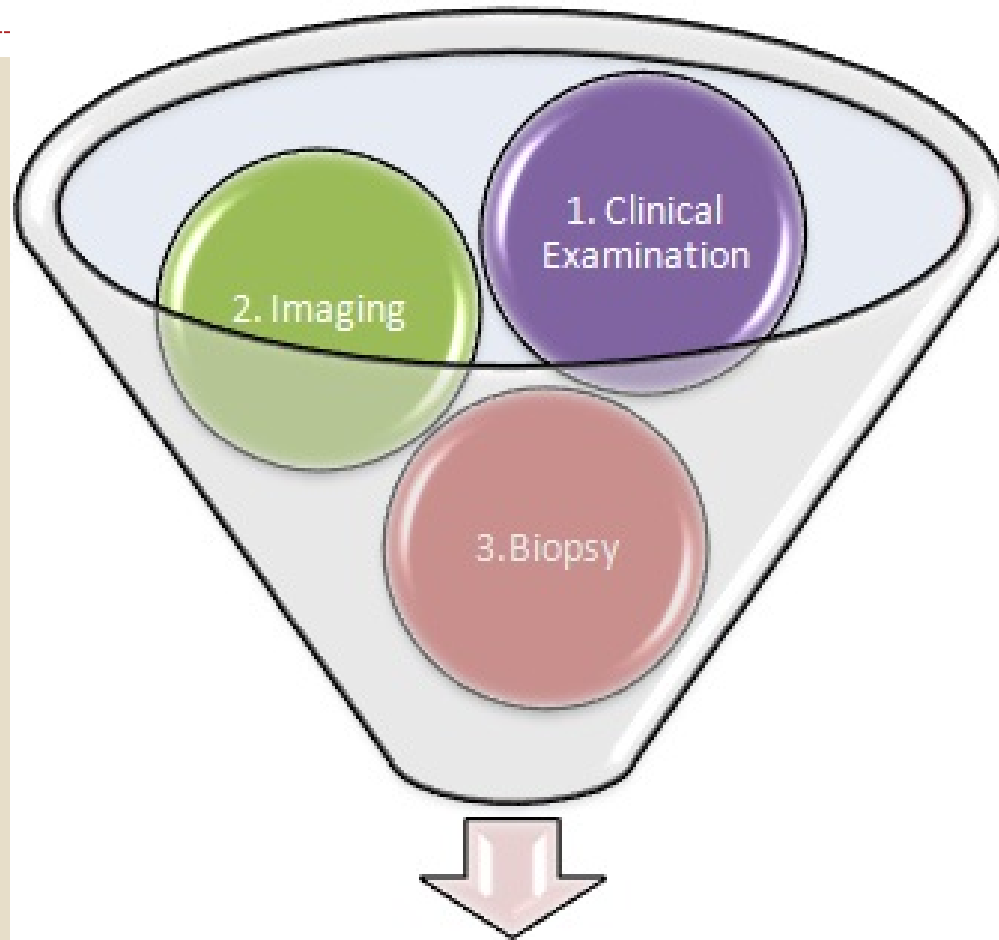

- 10% hereditary
- BRCA 1/2
- TP53, PTEN,
- *PALB2* (new gene)

BRCA Mutation Increases the Risk of Cancer

Triple Assessment

Breast Cancer Diagnosis

Frequency of cancers missed by each test

Clinical Breast Exam

Mammography

FNAC

Frequency of cancers missed in women
when all three tests have been performed

Triple Assessment !!!

0.5%

Radiological Investigations

Ultrasound scan

Breasts and Axillae

Mammography

Bilateral cancers: 5 – 10%

Multifocal cancers: 5 – 25%

Right

Left

Dense breasts

MRI scan

- Determine exact size of cancer
- Cancers not seen on USS/mammo
- High risk patients
- Dense breasts

Breast MRI

Biopsy

Under Ultrasound guidance

- **Core biopsy**

- **FNA**

USS-guided FNA / Core biopsy

Less false-negative results

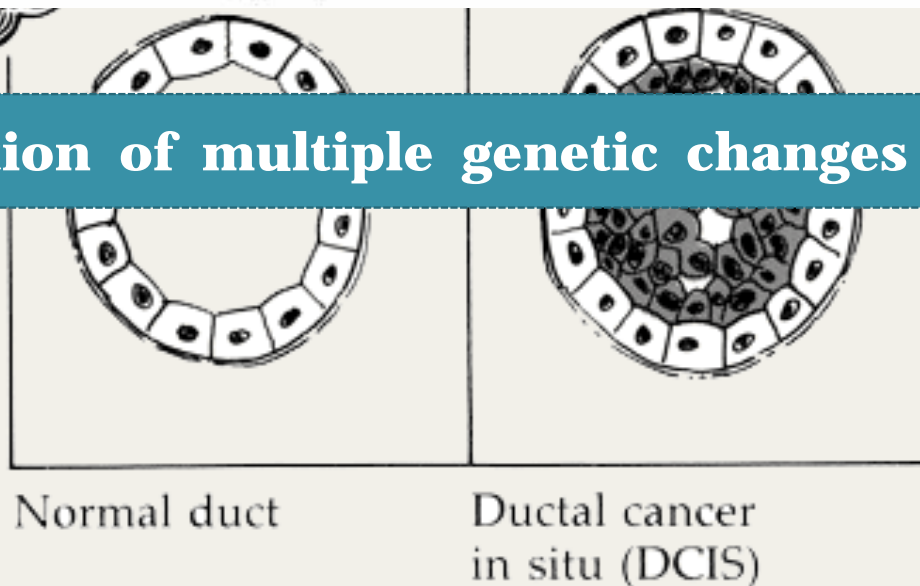

Pathology report

- Invasive ductal carcinoma, invasive lobular carcinoma,
- DCIS
- ER / PR
- Ki67
- Tumour size
- Tumour grade
(Grade 1 , Grade 2, Grade 3)
- Tumour margins

DCIS – Ductal Carcinoma in situ

Accumulation of multiple genetic changes

- **Grade 1**
- **Grade 2**
- **Grade 3**

Estrogen / Progesterone receptors (ER / PR)

Ki 67

- high levels of **Ki-67** = aggressive tumour = poor prognosis

Staging (5-year survival)

Stages of Breast Cancer

4

Spread of cancer beyond the immediate region of the breast.

- Metastatic breast cancer (MBC): ~5 - 10%

- limited role for surgery:

- More complications and deaths soon after surgery for MBC than for earlier-stage disease

1

Cells in the ducts or lobules of the breast result in a lump. Risk of cancer metastasis.

2

Cancer in the breast tissue. Tumor less than 1 inch across.

Cancer in the breast tissue. Tumor less than 2 inches across. Cancer may also spread to auxiliary lymph nodes.

3

Tumors larger than 2 inches across with extensive spread to auxiliary or nearby lymph nodes. Possible dimpling, inflammation or change of skin color.

4

Spread of cancer beyond the immediate region of the breast.

No difference in survival

SURVIVAL RATE

Treatment

Surgery

- The status of the axillary lymph nodes is one of the most important prognostic factors in women with early stage breast cancer.

Sentinel Lymph Node Biopsy

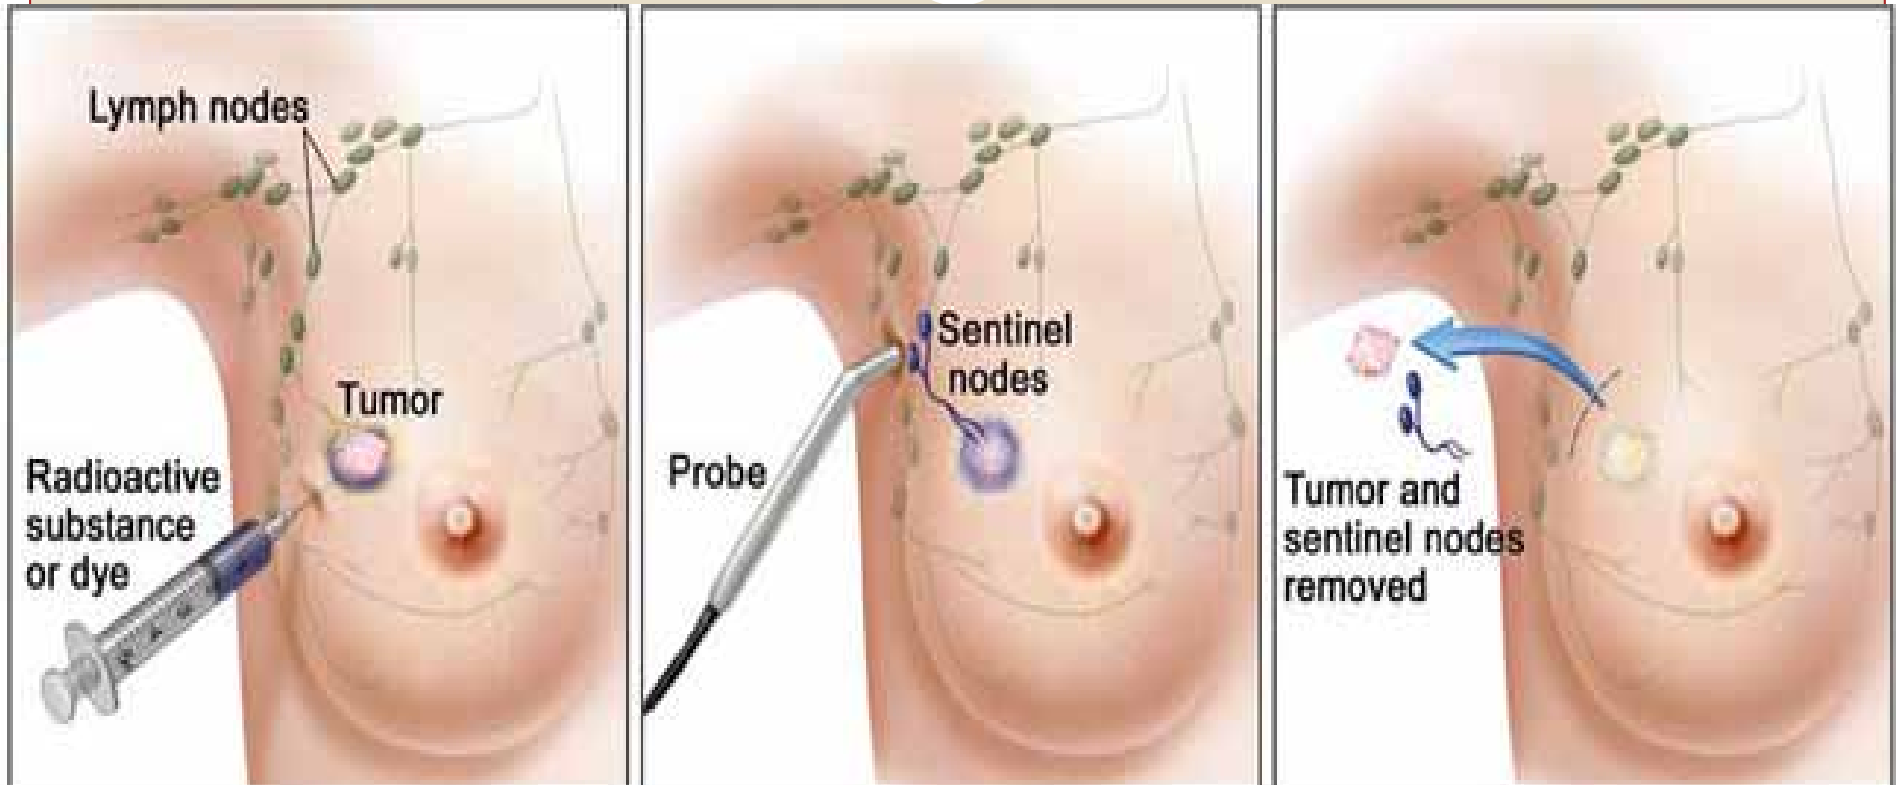

Sentinel Lymph Node biopsy => standard care for staging patients who have clinically node-negative disease.

**Localisation
using Blue Dye**

Localisation using **radioactive** tracer

Accuracy (combined technique) ~ 99%

Surgery

Axilla

Breast

Breast Conserving
Surgery

Mastectomy

Lumpectomy (wide local excision)

- Remove cancer with a rim of normal breast tissue

Breast-Conserving Surgery: Criteria

- Small tumor-to-breast size
- Not more than one tumor in the same breast (unicentric)
- Negative tumor margins
- No contraindications for radiation

Second operation: Re-excision to clear margins (~20%)

Short = **S**uperior
Long = **L**ateral
Loop = **D**eep

Neo-adjuvant chemotherapy

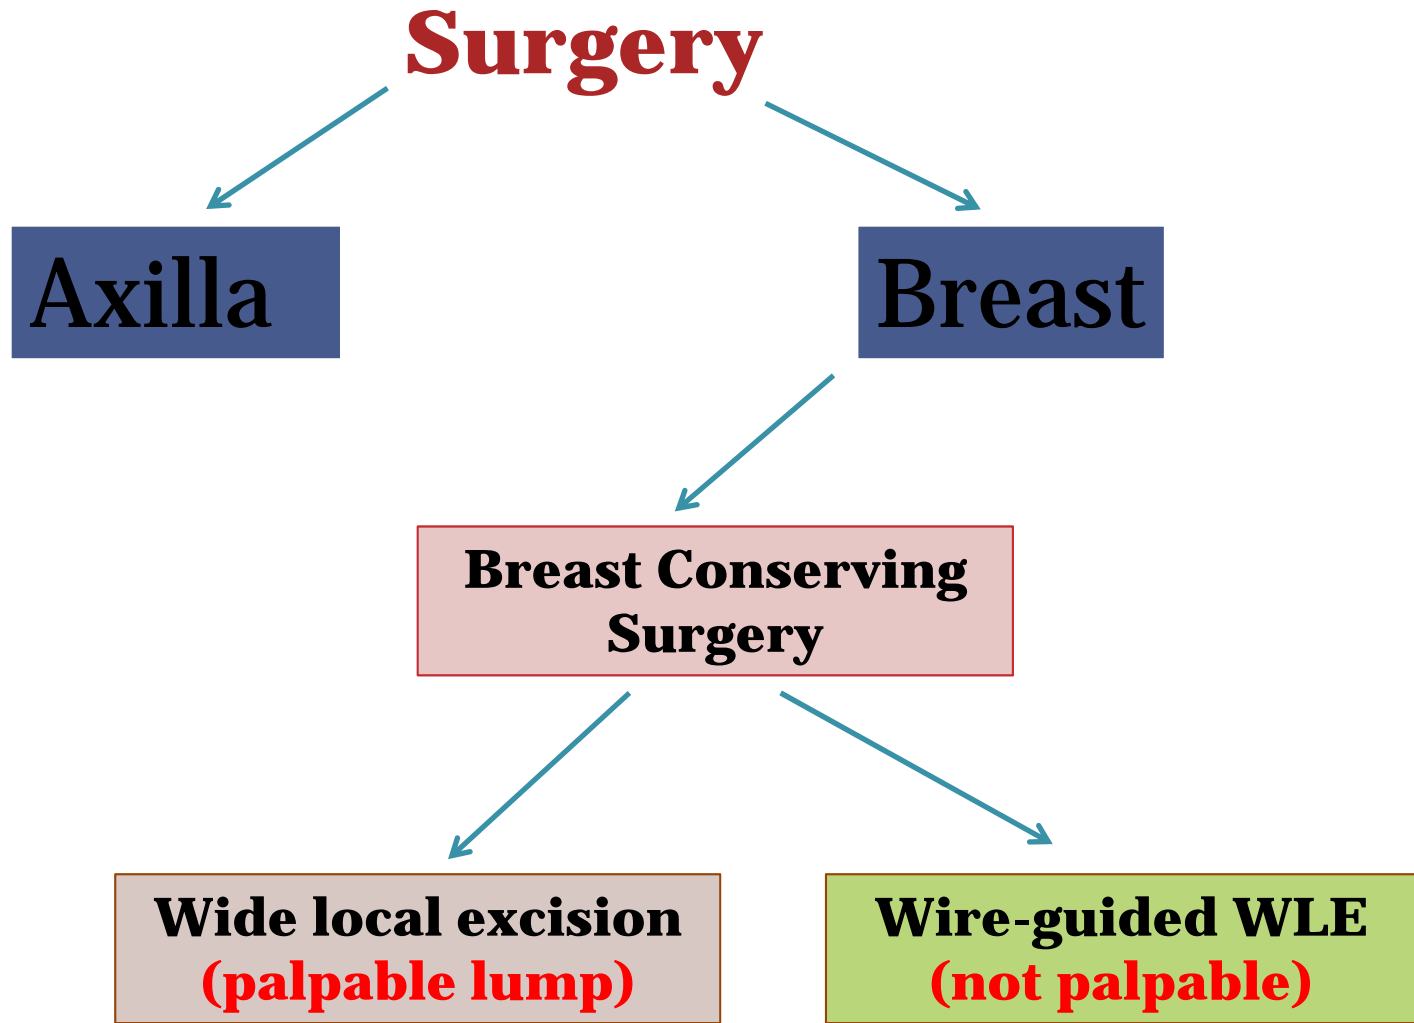

A

B

C

Mammogram image

Wire-guided lumpectomy

Post-op

ng

D- Fat is re-injected using very fine cannulas

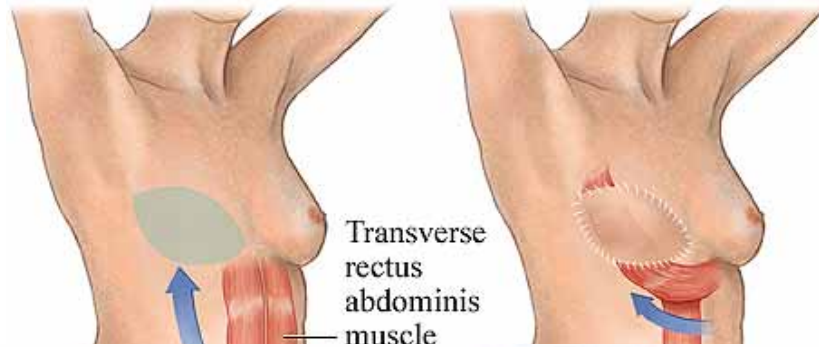

C- Fat is treated and centrifuged

Angelina Jolie

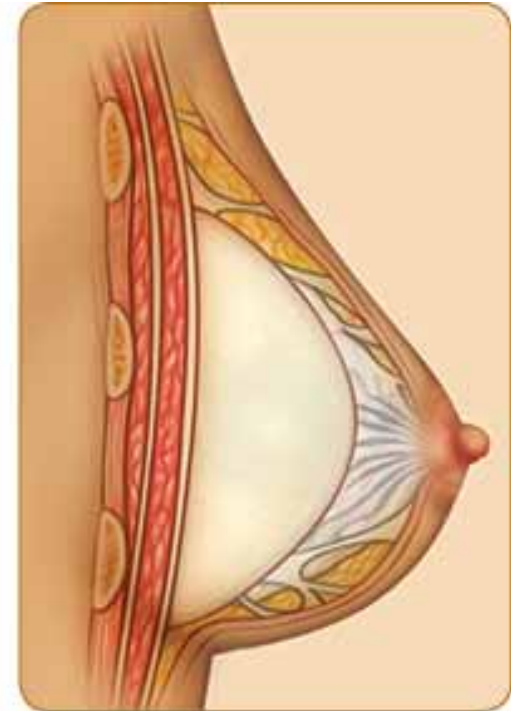

- Bilateral risk-reducing mastectomy
- Survival benefit
- 1 - 2% will have occult cancer in mastectomy specimen
- Reduces risk of BC by ~90 - 95%

Breast Reconstruction

1. Submuscular

2. Subglandular

Hormone Therapy

Tamoxifen Blocks Estrogen Receptors

Tamoxifen enters a cancer cell and binds to estrogen receptors.

When estrogen enters the cell, it can't bind to the receptors.

Cancer cell proliferation is prevented.

- When used as adjuvant therapy after surgery in patients with early breast cancer it leads to **Improved overall survival.**
- 50% reduction in risk of developing cancer in other breast
- For ER-positive cancers, allocation to about 5 years of Tamoxifen reduces the annual breast cancer death rate by 31%

Chemotherapy

Chemo-prevention

- Tamoxifen and Raloxifene reduce the risk of breast cancer in women at increased risk of disease

Cancer Prevention Tip:
Chemoprevention & Breast Cancer

Abramson Cancer Center

- Tamoxifen – 50% reduction of BC in other breast for BRCA1/2 mutation carriers

Normal breast cancer cell

Normal amount of HER2 receptors send signals telling cells to grow and divide.¹

Abnormal HER2+ breast cancer cell

Too many HER2 receptors send more signals, causing cells to grow too quickly.¹

Herceptin

- About 15 – 20% of all breast cancers are HER2+
- **Significant correlation between HER2 over-expression and poor clinical outcome**
- HERCEPTIN - Reduces breast cancer recurrence by ~ 36% and mortality by ~ 40%

Xray - Radiotherapy

- 50% reduction in any first recurrence
- **reduces breast cancer death ~15%**

Future

Tomosynthesis / 3D mammography

2D Mammogram

3D Mammogram:
Cancer Detected

Oncotype DX

**Oncotype DX[®] reveals
the underlying biology that
changes treatment decisions
37% of the time**

Uncover the Unexpected™

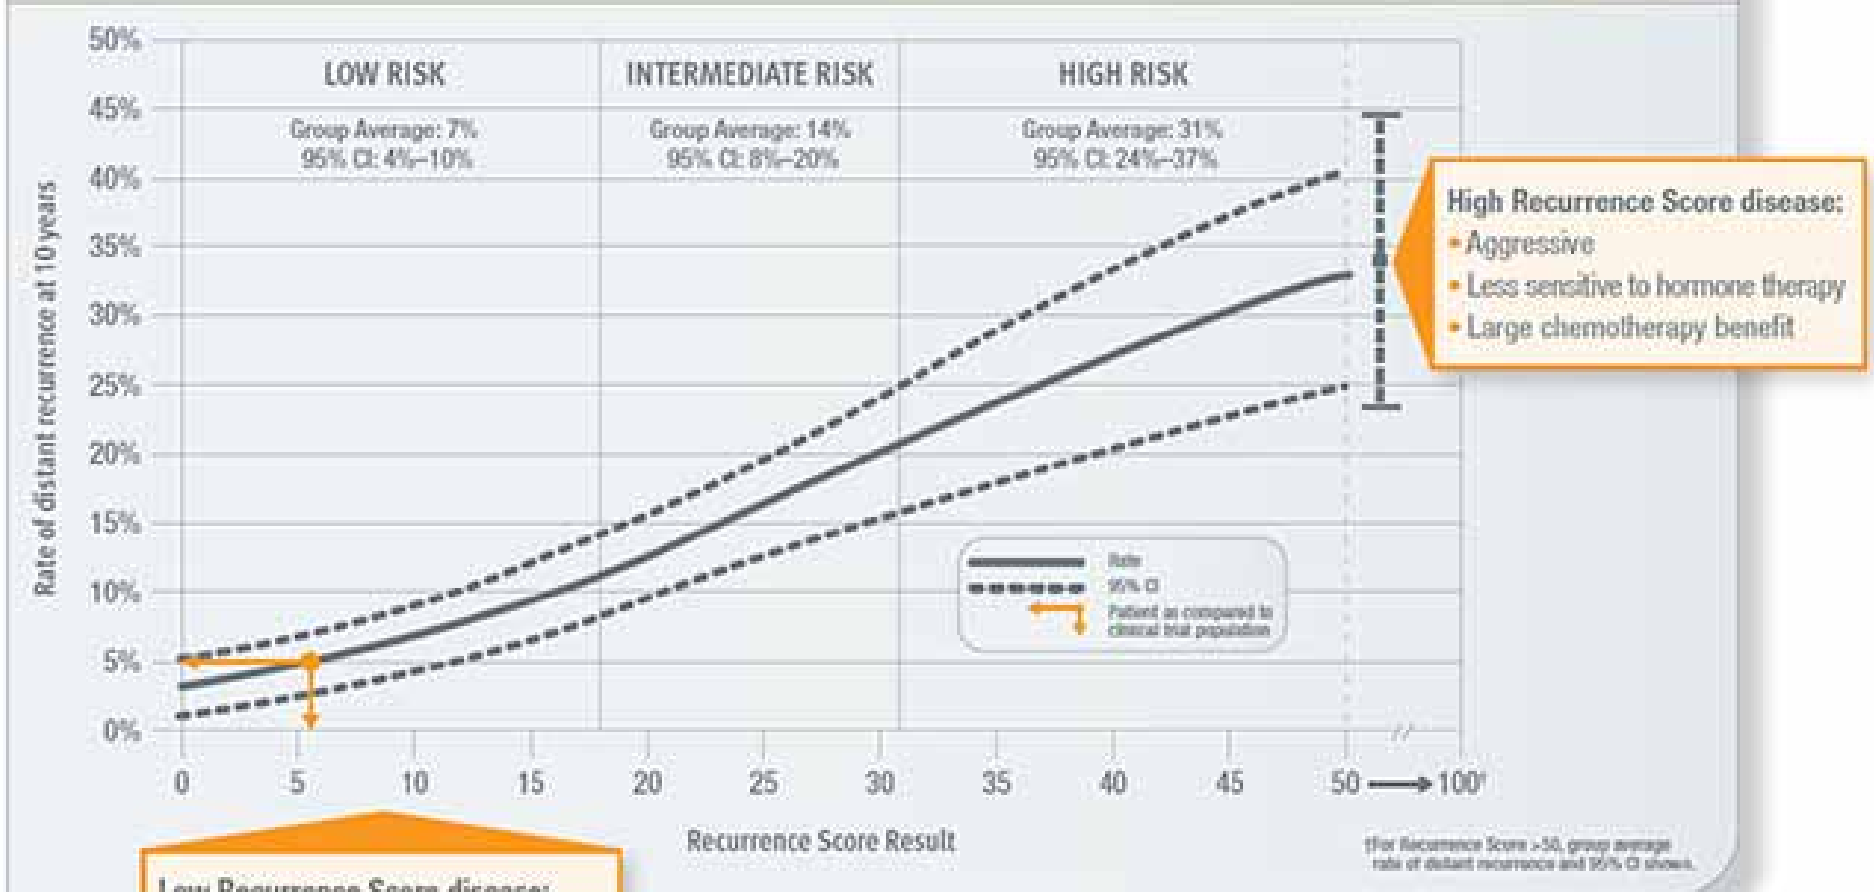

Oncotype DX

- Looks at the presence and activity of a group of genes within a woman's breast tumour to determine the likelihood of breast recurrence
- Predict the likelihood of chemotherapy benefit as well as recurrence in early-stage breast cancer.
- **Recurrence Score** of 0 to 100 points. A low score indicates a low risk of recurrence and a high score indicates a high risk of recurrence

Oncotype DX

The Recurrence Score result reflects an individual's unique tumor biology

Low Recurrence Score disease:

- Indolent
- Hormone therapy-sensitive
- Minimal, if any, chemotherapy benefit

Test helps individualize treatment planning for breast cancer patients

Intra-operative Radiotherapy

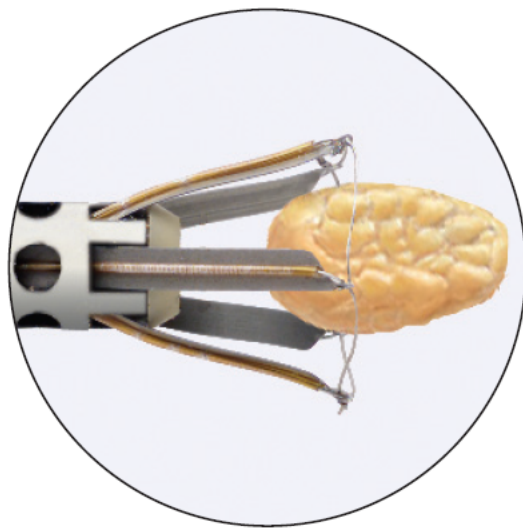

Intra-operative Radiotherapy

Portable Radiotherapy ?

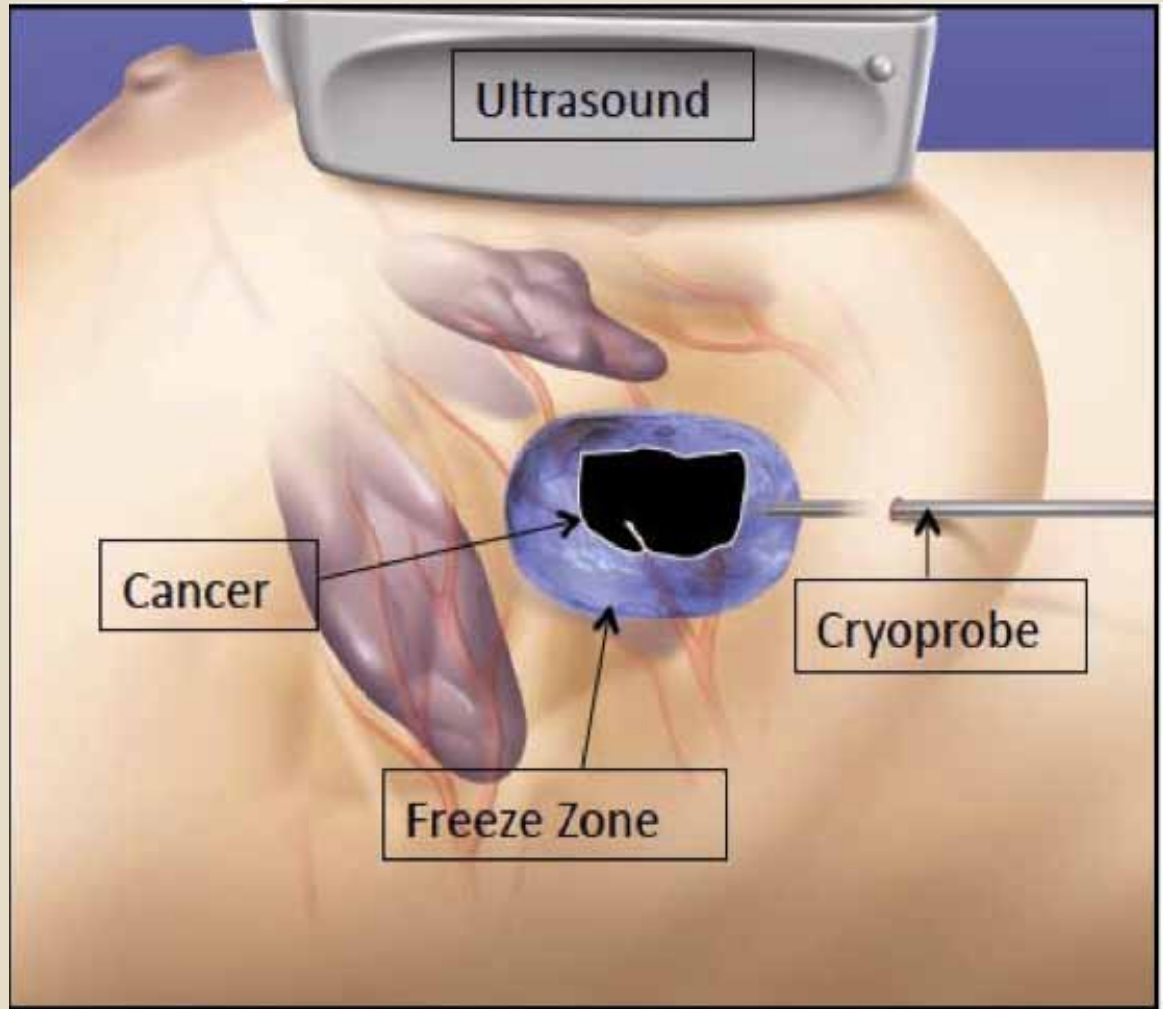

Radiofrequency ablation

Intact Advance

Capture basket—Five small RF-enabled wires deploy from the wand to circumscribe the lesion. As they proceed, they draw out five supporting elements which support and cradle the sample for withdrawal.

Cryoablation

Thank  You

Questions ?

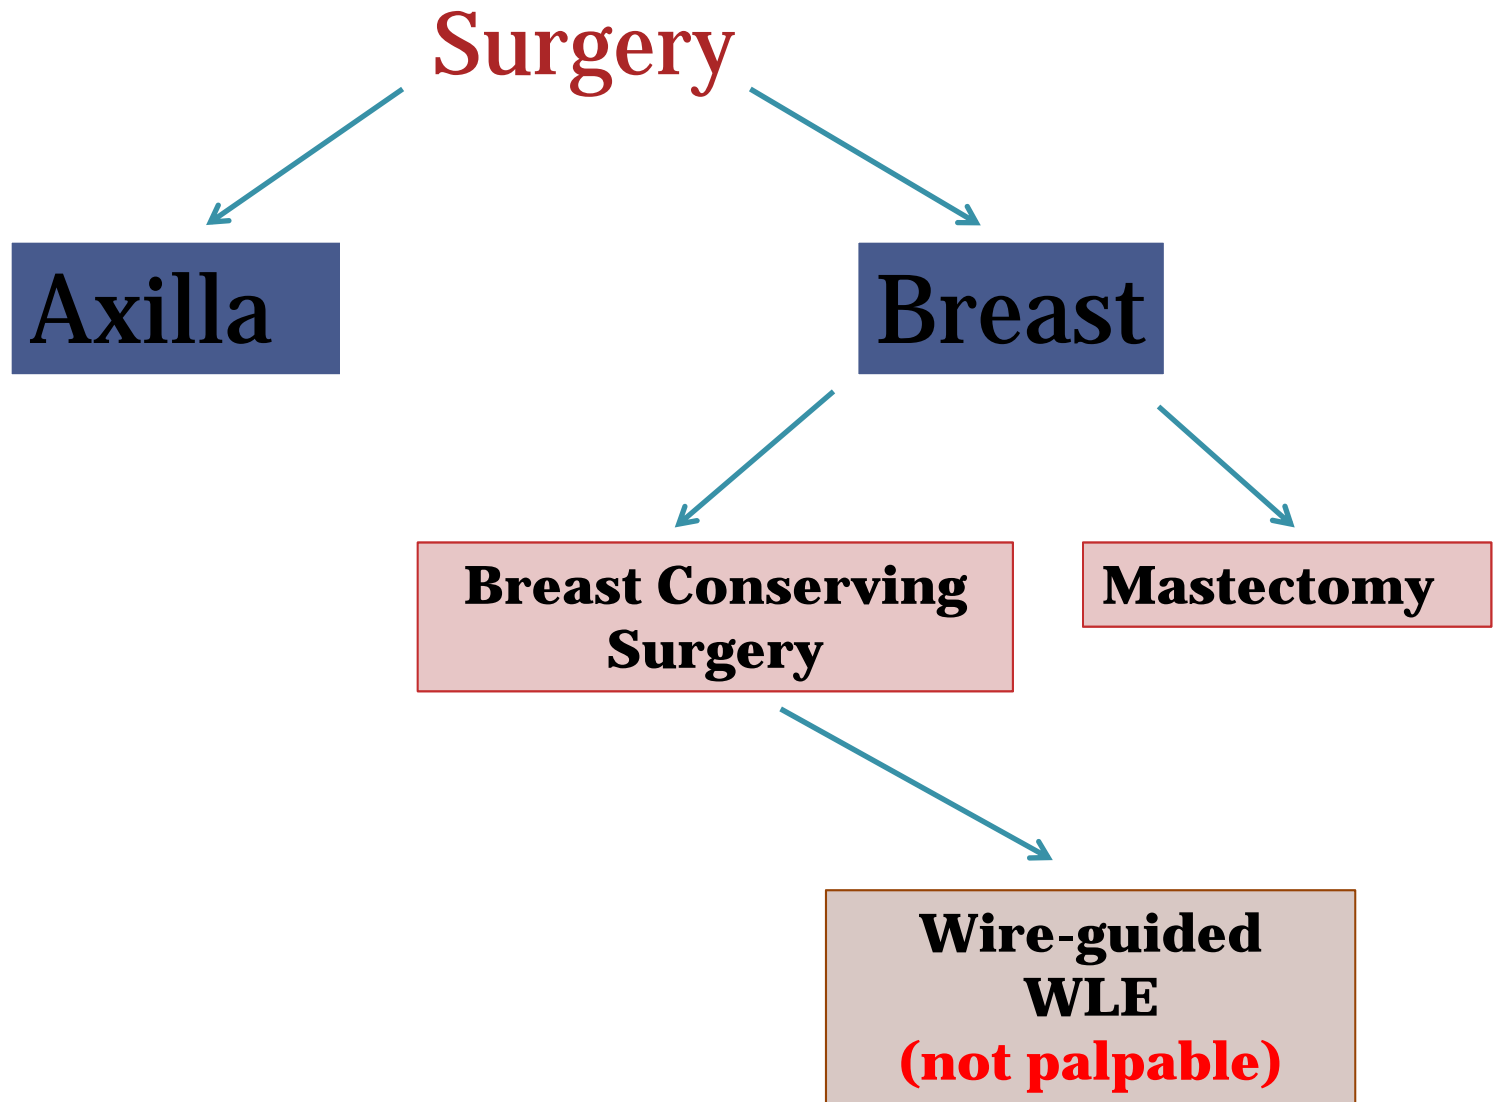

BRCA1 Breast Cancer Risk by Age

Graph 1. Blue bar indicates the average risk (percent chance) that a woman with a *BRCA1* mutation will develop breast cancer by each age noted across the bottom. The vertical line on each bar indicates a portion of the range of risks seen in different studies and is called the 95% confidence interval (Chan & Parmigiani 2007).

Coil

Endocrine Therapy in Postmenopausal Patients

Emitting chemicals that stimulate cell growth

Oestrogen receptor Oestrogen

Oestrogen binds to oestrogen receptors

Cancer cells stop growing

Oestrogen Oestrogen receptors

Tamoxifen blocks oestrogen receptors in order to prevent oestrogen from reaching the tumour.
